Skeeter's face likely Has a Mask on the Muzzle and a Brown nose

✓ Skeeter's tail is likely Normal in length

These tests were developed and performed by Paw Print Genetics®, Spokane WA.

Explanation of Results

Normal A "normal" result means that your dog does not have the mutation that causes the

associated genetic disease.

Carrier A "carrier" result indicates that your dog has inherited one copy of the mutation that has

been reported to cause this genetic disease. Your dog may not be clinically affected by this

mutation because two copies of the mutation are usually required to cause disease.

At-Risk An "at-risk" result indicates that your dog may have inherited one or two copies of the

mutation that has been reported to cause this genetic disease. Depending on the mode of genetic inheritance for this particular disease, inheriting one **or** two mutant copies of the gene may result in the disease. *You may want to consider ordering follow-up testing to*

confirm the results of this initial screen for any dog that is "at-risk" for a disease.

Failed A "failed" result indicates that we were unable to obtain a genotype for your dog for this

specific disease or trait and does not mean that your dog is a carrier or at-risk for this disease. There are a variety of reasons why a specific test may fail. However, we promise to

provide at least 150 results to you for your dog.

Please review our testing terms and disclaimers regarding your results.

The results below have been filtered and are specific for the following categories:

Breeds:	Symptoms:	Body System:
Australian Shepherd	All	AII
